PRESENTING CLINICAL SIGNS

Pet developed acute sneezing a few weeks ago. No significant discharge present, no epistaxis noted. No medical therapy initiated at this time.

COMPUTED TOMOGRAPHY OF THE SKULL

A high resolution pre- and post-contrast CT study of the skull is provided for review.

COMPUTED TOMOGRAPHIC FINDINGS

The pictured parts of the dentition are complete and unremarkable in all jaw quadrants.

In both nasal cavities, a small amount of fluid attenuating material is attached to the nasal mucosal lining. Generalized mild thickening of the nasal mucosal lining is appreciated.

Both temporomandibular joints present congruent joint spaces with even subchondral bone surfaces and are considered within normal limits.

Both tympanic bullae are aerated, the mucosal lining is not seen, the bony wall is smooth and thin. The external ear canals are within normal limits.

The brain presents no deviation from normal anatomy and symmetry. The brain parenchyma is homogeneous and within normal limits for attenuation and distribution of contrast enhancement. The ventricular system is non-dilated and symmetric.

The submandibular and medial retropharyngeal lymph nodes are small and elongated with a normal short-to-long-axis-ratio is < 0.5, the attenuation and contrast enhancement pattern is uniform.

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Rhinitis

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The CT study is consistent with rhinitis, and the presumptive diagnosis is non-specific rhinitis (e.g. allergic, lymphocytic plasmocytic, eosinophilic, allergic) ± bacterial. There is no evidence of nasal mass nor odontogenic rhinitis. Rhinoscopy including biopsy may be performed for specification.
