PRESENTING CLINICAL SIGNS

Pet has a nasal congestion.

COMPUTED TOMOGRAPHY OF THE SKULL

A high resolution pre- and post-contrast CT study of the skull is provided for review.

COMPUTED TOMOGRAPHIC FINDINGS

Triadan 106 and 206 are absent. Triadan 307 and 407 presents advanced resorptive lesions of the crown and roots.

The nasal cavities are obliterated by fluid attenuating material and mild destruction of the nasal conchal structures is appreciated.

Both temporomandibular joints present congruent joint spaces with even subchondral bone surfaces and are considered within normal limits.

Both tympanic bullae are aerated, the mucosal lining is not seen, the bony wall is smooth and thin. The external ear canals are within normal limits.

The brain presents no deviation from normal anatomy and symmetry. The brain parenchyma is homogeneous and within normal limits for attenuation and distribution of contrast enhancement. The ventricular system is non-dilated and symmetric.

The submandibular and medial retropharyngeal lymph nodes are small and elongated with a normal short-to-long-axis-ratio is < 0.5, the attenuation and contrast enhancement pattern is uniform.

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Destructive rhinitis
- Dental resorptive lesions 307 and 407
- Absent triadan 106 and 206

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The most common cause for destructive rhinitis in feline patients is primary viral ± bacterial or less likely mycotic superinfection. Rhinoscopy including sampling for histopathology and microbial culture can be used for specification - in many cases the initial causative infectious agent cannot be isolated anymore. I do not see signs for nasal mass. In chronic cases of rhinosinusitis clinical signs are prone to reoccur.
