

**PATIENT PRESENTING CLINICAL SIGNS**

Alvin Flinn
History: Second recheck on chest previous upload (case-upload-1634918242) doing well at home still on antibiotics
Abnormal PE/Chem/CBC/UA Results:

SPECIES RADIOGRAPHIC STUDY OF THE THORAX

Canine
Radiographs of the thorax in three imaging planes are provided for review.

BREED RADIOGRAPHIC FINDINGS

Beagle
Multifocal mild spondylosis formation is seen along the caudal thoracic spine.
The extrathoracic soft tissues present homogeneous without abnormalities.

SEX

Neutered Male
The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

AGE

11 Years
The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.
The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

INTERPRETED BY

Sebastian Schaub,
DVM Dr. med. vet.
DipECVCI

There is mild regression of the peribronchial cuffing. The lung parenchyma presents generalized mild ground glass opacification caused by an unstructured reticular lung pattern.
The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

RADIOGRAPHIC DIAGNOSIS**HOSPITAL NAME**

Sylvan Lake VC

- Mild bronchial lung pattern – regressive
- Unstructured interstitial pattern
- Spondylosis deformans

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**REFERRING VET**

Dr. Babette
Baskerville

There is regression of the radiographic changes. The unstructured interstitial pattern is likely accentuated by age related changes of the lung parenchyma. No evidence of pneumonia.

The information and recommendations provided are based on the images presented by the referring veterinarian. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.
