

PATIENT

Cindy Singh

PRESENTING CLINICAL SIGNS

Diarrhea - started 2 days ago - on and off Lump on stomach is getting bigger
 Abnormal PE/Chem/CBC/UA Results: CBC- WNL T4- 0.78 CPL- Normal explained surgical removal of mass and biopsy and possible Dental cleaning, explained possible anesthestc risks due to age and breed

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE THORAX & ABDOMEN

A complete set of radiographs of the thorax and abdomen is provided for review.

BREED

Pug

RADIOGRAPHIC FINDINGS

Thorax

SEX

FS

The surrounding bony structures are within normal limits.

The extrathoracic soft tissues present homogeneous without abnormalities.

AGE

10 Years

The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

INTERPRETED BY

Sebastian Schaub, DVM
 Dr. med. vet. DipECVDI

Moderate dorsoventral flattening of the cervical segment of the trachea is present.

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

HOSPITAL NAME

Animal Paradise
 Hospital

The lung parenchyma presents the expected architecture and opacity; the intrapulmonary vascular branching is seen up to the third order lung vessels.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

REFERRING VET

Dr. Elshafie

Abdomen

Both coxofemoral joints present moderate osteophyte new bone formation. The acetabular groove bilaterally is shallow, and the center of the femoral heads is lateral to the dorsal acetabular rim.

INVOICE

48266

In the right inguinal region, an irregular marginated mass is visible protruding from the cutaneous surface, measuring approximately 3.6 x 1.9 cm in size.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

DATE

11-6-21

The liver is appropriate in position, size and presents uniform opacity.

The cranial extremity of the spleen is seen in its anticipated position and presents an irregular increased volume

**PATIENT**

Cindy Singh

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

The stomach is in its anticipated position and presents normal content.

SPECIES

Canine

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

The colon is seen in the expected position and presents with appropriate content.

BREED

Pug

RADIOGRAPHIC DIAGNOSIS

- Cutaneous soft tissue mass right inguinal region
- Enlarged cranial extremity of the spleen
- Tracheal collapse
- Degenerative osteoarthritis coxofemoral joints bilaterally due to hip dysplasia
- No evidence of pulmonary metastatic disease

SEX

FS

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**AGE**

10 Years

The cutaneous mass is consistent with the history and surgical excision has already been scheduled as indicated – soft tissue neoplasia is likely.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

The irregular enlargement of the cranial extremity of the spleen is concerning for splenic mass – such as nodular hyperplasia, neoplasia (primary versus metastasis). Recommend an ultrasound examination to confirm the diagnosis.
