

**PATIENT**

Nelli Ballard

PRESENTING CLINICAL SIGNS

Lameness on right front since 10/2021. Pain level does seem to correspond w/ P's level of activity. Undiagnosed area of cause/concern. Previous CT of elbows showed normal age related findings. Upon examination today, P did show a pain response of flexion of carpus.

SPECIES

Canine

COMPUTED TOMOGRAPHY OF THE RIGHT FRONT LIMB

A high resolution plain CT study of the right front limb is provided for review.

BREED

Labrador Retriever

COMPUTED TOMOGRAPHIC FINDINGS

The osseous and surrounding soft tissue structures of the right shoulder joint are within normal limits.

SEX

FS

The right carpal joint presents a subjective mild periarticular soft tissue swelling. Multiple osseous spurs are protruding from the distal surface of the right accessory carpal bone.

AGE

4 Years, 2 Months

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Possible mild articular swelling right carpal joint
- Enthesophyte formation distal surface right accessory carpal bone
- Structural normal right shoulder joint

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The current CT study presents no specific abnormality, explaining the right front limb lameness. There is subjective mild swelling of the carpal joint, check clinically for evidence of joint effusion (e.g. degenerative, traumatic, inflammatory). The enthesophyte formation at the right accessory carpal bone is considered as an incidental finding.

HOSPITAL NAME

State Avenue Vet
Clinic

The shoulder joint presents without abnormalities. In case of strong clinical suspicion for pathology of the bicipital tendon or rotator cuff injury, recommend complementing workup by an ultrasound examination of the shoulder joint.
