PRESENTING CLINICAL SIGNS

LF lameness intermittent cannot isolate nidus progressive worsening
Abnormal PE/Chem/CBC/UA Results: cbc/chem mild azotaemia

COMPUTED TOMOGRAPHY OF THE SHOULDER AND ELBOW JOINTS

A pre- and post-contrast CT study of the shoulder and elbow joints in a bone and soft tissue reconstruction is provided for review.

COMPUTED TOMOGRAPHIC FINDINGS

Both shoulder joints present smooth margins of the periarticular bones and the surrounding soft tissue structures are within normal limits.

The region of the brachial plexus reveals no abnormalities.

The elbow joints have smooth margins of the periarticular bones. The medial coronoid process of both elbow joints is well-defined and has a homogeneous density. The surrounding soft tissue structures of the elbow joints reveals no abnormalities.

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Normal shoulder joints
- Normal elbow joints

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The CT study reveals no abnormalities and an underlying cause for the intermittent left front limb lameness cannot be specified.

The information and recommendations provided are based on the images presented by the referring veterinarian/sonographer. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.

Thank you for this referral. If the clinical or image interpretation does not parallel your findings or if I can be of any further assistance please contact me.
