

**PATIENT**

Bruno Oprea

**PRESENTING CLINICAL SIGNS**

P presented for sedated radiographs of the hips and knees to evaluate for development of hip dysplasia and other breed related joint issues.

**SPECIES**

Canine

Abnormal PE/Chem/CBC/UA Results: Mild angular limb positioning of the hindlimbs occasionally at stand (valgus) Moderate sloping of the hind end/dropping of hocks conformation No pain on manipulation of the hindlimbs

**BREED**

German Shepherd

**RADIOGRAPHIC STUDY OF THE PELVIS AND STIFLE JOINTS**

A VD projection of the pelvis and mediolateral & craniocaudal projections of the stifle joints are provided for review.

**SEX**

Male Neutered

**RADIOGRAPHIC FINDINGS**

The radiograph of the pelvis is moderately rotated to the right. The periarticular osseous structures of the right coxofemoral joint present mild to moderate osteophyte new bone formation. The sclerosis of the subchondral bone of the craniolateral acetabular rim is moderately widened on the right side.

**AGE**

4 Years

The left femoral head has a broomstick like conformation. No abnormalities are appreciated.

Both stifle joints present with smooth osseous margins and without evidence of intracapsular soft tissue swelling.

**INTERPRETED BY**

Sebastian Schaub, DVM  
Dr. med. vet. DipECVDI

**RADIOGRAPHIC DIAGNOSIS**

- Mild degenerative osteoarthritis right coxofemoral joint due to hip dysplasia
- Normal left coxofemoral joint
- Normal stifle joints

**HOSPITAL NAME**

Boca Park Animal Hospital

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

There is evidence of right sided mild hip dysplasia with secondary mild degenerative joint disease of the right coxofemoral joint. The clinical relevance is questionable if the patient is kept in constant training with well-developed musculature.

**REFERRING VET**

Tifanie Silver

The stifle joints are within normal limits.
