SPECIES

Canine

RADIOGRAPHIC STUDY OF THE ABDOMEN

A full set of radiographs of the abdomen is provided for review. Radiographs are provided in JPEG file format.

BREED

Siberian Husky

RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

SEX

Male

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

AGE

11 Months

The hepatic volume is within normal limits and presents a homogeneous opacity.

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

HOSPITAL NAME

Wilson Road Vet
Clinic

The stomach is in its anticipated position and presents normal content.

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

REFERRING VET

Dr. Ehab Yessa

The colon is seen in the expected position and contains a mild to moderate amount of gas and foamy fecal material.

RADIOGRAPHIC DIAGNOSIS

- History of diarrhea

INVOICE

48952

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

There is no evidence of radiopaque foreign material or signs for gastrointestinal mechanical obstruction and the presumptive diagnosis is gastroenteritis. If clinical signs are refractory to therapy, recommend follow up radiographs or a complete abdominal ultrasound examination.
