

**PATIENT**

Noodles Rhoades

**PRESENTING CLINICAL SIGNS**

History: Lameness Painful left Leg and left elbow.  
Abnormal PE/Chem/CBC/UA Results:

**SPECIES**

Canine

**RADIOGRAPHIC STUDY OF THE SHOULDER & ELBOW JOINTS**

Radiographs of the shoulder and elbow joints in two imaging planes are provided for review.

**RADIOGRAPHIC FINDINGS**

**BREED**

St. Bernard

The growth plates are age-related open.

The humeral head of the left shoulder joint is partially superimposed on the sternum. Both shoulder joints present smooth osseous margins and the surrounding soft tissue structures are within normal limits.

**SEX**

Female

Both elbow joints present smooth osseous margins of the subchondral bones. In the subcutaneous tissue cranial to the right elbow joint/proximal antebrachium, a mild to moderate swelling with multiple small gas inclusions is visible – suspect preceding injection.

**AGE**

6 Months

**RADIOGRAPHIC DIAGNOSIS**

- Soft tissue swelling cranial to right elbow joint – likely due to preceding injection
- Normal shoulder joints
- Normal elbow joints

**INTERPRETED BY**

Sebastian Schaub,  
DVM Dr. med. vet.  
DipECVDI

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The radiographic study of the left front limb presents without abnormalities. If clinical signs persist under empirical management, complementing workup by a CT study of the front limbs might be considered.
