

PATIENT

Kahli Salina

PRESENTING CLINICAL SIGNS

multiple partial seizures - every three hours - jaw chomping/salivating, maintains consciousness
 Abnormal PE/Chem/CBC/UA Results: haem/chem normal "puppy" panel Bile acids marked elevation postprandial BA

SPECIES

Canine

COMPUTED TOMOGRAPHY OF THE ABDOMEN

A pre- and post-contrast CT study of the abdomen is provided for review.

BREED

Dashchund

COMPUTED TOMOGRAPHIC FINDINGS

The serosal fat presents normal attenuation behavior. There is no evidence of peritoneal effusion or peritonitis.

Both kidneys present within normal limits for size, shape and organ architecture. After contrast administration a bilaterally symmetric and uniform nephro- and pyelogram is noted.

SEX

FE

The adrenal glands are within normal limits for size, shape and organ architecture.

Both liver and spleen present with normal shape, even surface, uniformly attenuating parenchyma and homogeneous contrast enhancement, unremarkable.

AGE

16 Weeks

The portal vein presents a normal order of its tributary veins and intrahepatic branching. No abnormal vessel is noted inside and outside of the liver parenchyma.

INTERPRETED BY

Sebastian Schaub, DVM
 Dr. med. vet. DipECVDI

The pancreas is evenly contoured, the pancreatic parenchyma is homogeneous and presents uniform contrast enhancement.

The position, delineation, wall and content of the gastrointestinal tract are considered within normal limits throughout.

The bony and surrounding soft tissue structures reveal no abnormalities.

HOSPITAL NAME

Advanced Veterinary
 Imaging

COMPUTED TOMOGRAPHIC DIAGNOSIS

- No evidence of portosystemic shunting, neither intra- nor extrahepatic

REFERRING VET

Eamon

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

No macroscopic vascular bypass of the liver was noted in the pre- and post- contrast studies of the abdomen. However, if the clinical signs are consistent with insufficiency of the liver primary non-cirrhotic portal hypertension (microvascular dysplasia) or other diffuse parenchymal liver disease would still be a potential and should be ruled out by means of ultrasound guided or surgical liver biopsy.
