

**PATIENT PRESENTING CLINICAL SIGNS**

Gogol Bezaheyi History: Occasional limping on left hind leg, O says getting worse after worse after jumping off couch. Positive drawer test on left hind leg.  
Abnormal PE/Chem/CBC/UA Results:

**SPECIES RADIOGRAPHIC STUDY OF THE STIFLE JOINTS**

Canine A full set of radiographs of the stifle joints is provided for review.

**BREED RADIOGRAPHIC FINDINGS**

Golden Doodle Both stifle joints present smooth margins. The left stifle joint presents a moderate intracapsular soft tissue swelling, displacing the infrapatellar fat pad and disorting the fascial plane caudally. The right stifle joint presents the expected volume of the intracapsular soft tissue material.

**SEX RADIOGRAPHIC DIAGNOSIS**

Neutered Male
 

- Articular swelling left stifle joint
- Normal right stifle joint

**AGE INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

4 Years The most common cause for the joint effusion of the stifle joint is pathology of the cranial cruciate ligament ± meniscal pathology. Other potentials include traumatic, degenerative or primary inflammatory. The clinically appreciated positive drawer test is confirming the diagnosis of pathology of the cranial cruciate ligament and surgical intervention should be considered.
