

PATIENT

Ghost Timinski

SPECIES

Canine

BREED

Siberian Husky Mix

SEX

Neutered Male

AGE

7Y, 7M

WEIGHT

82lbs

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet.
DipECVDI

IMAGING PERFORMED BY

Allison

HOSPITAL NAME

Elizabeth Animal
Hospital

REFERRING VET

Kim Allyn, DVM

INVOICE

72825

DATE

12-2-25

PRESENTING CLINICAL SIGNS

Met check after cancerous mass removed.

RADIOGRAPHIC STUDY OF THE THORAX

Radiographs of the thorax in three imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

The extrathoracic soft tissues present homogeneous without abnormalities.

The heart is of normal size and shape; there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

Multifocal throughout the lung parenchyma, well-defined, soft tissue opaque nodules are seen; measuring up to 22 mm in diameter.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

RADIOGRAPHIC DIAGNOSIS

- Structured nodular interstitial lung pattern

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The pulmonary nodules in combination with the history of excision of a malignant mass are consistent with pulmonary metastatic disease.
