PRESENTING CLINICAL SIGNS

limping on left front leg - pain on palpating left shoulder need to rule out OCD vs. dysplasia vs. others

RADIOGRAPHIC STUDY OF THE SHOULDER JOINTS

A complete set of radiographs of the shoulder joints is provided for review.

RADIOGRAPHIC FINDINGS

Both shoulder joints present smooth margins of the periarticular bones and the surrounding soft tissue structures are within normal limits.

At the distal aspect of the right acromion, two isolated, well-defined, ossified bodies are seen. At the cranial aspect of the neck of the right scapula a rudimentary clavicle is seen.

RADIOGRAPHIC DIAGNOSIS

- Isolated ossification center distal aspect acromion right scapula - incidental
- Normal shoulder joints

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study of the shoulder joints reveals no clinically relevant abnormalities are appreciated. If clinical signs persist, workup can be complemented by an ultrasound examination of the respective shoulder joint.
