PRESENTING CLINICAL SIGNS

Pt presented for stiffness in getting up and down. Pt indoor/outdoor, hasn't seen any wounds on him. PE in exam, no obvious point of pain, possibly on lumbar spine.

RADIOGRAPHIC STUDY OF THE LUMBAR SPINE AND PELVIS

Radiographs of the lumbar spine and pelvis in orthogonal image planes are provided for review.

RADIOGRAPHIC FINDINGS

Six lumbar vertebra are present.

The intervertebral disc space L4/L5 is narrowed.

The remainder of the osseous and soft tissue structures of the lumbar spine reveal no abnormalities.

The osseous and surrounding soft tissue structures of the pelvis are within normal limits. Both coxofemoral joints present mild osteophyte new bone formation. The acetabular groove bilaterally is shallow, and the center of the femoral heads is lateral to the dorsal acetabular rim.

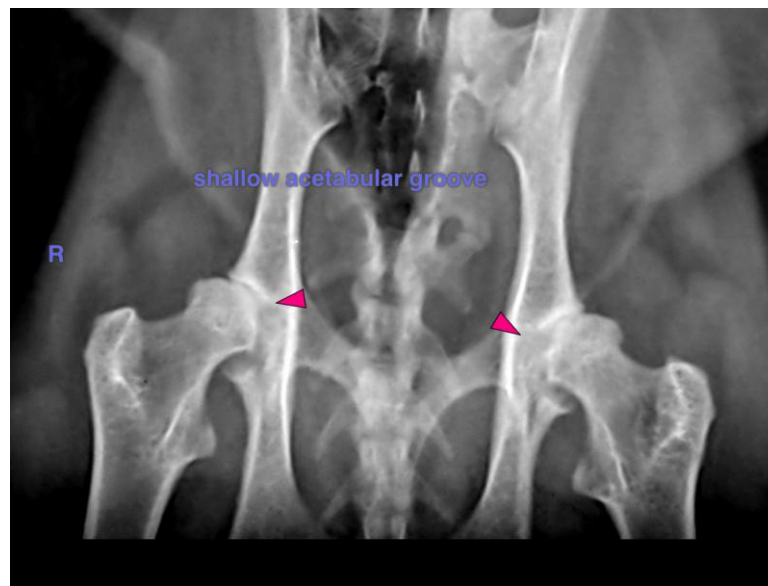

RADIOGRAPHIC DIAGNOSIS

- Discopathy L4/L5
- Mild osteoarthritis coxofemoral joints due to hip dysplasia

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The narrowed intervertebral disc space L4/L5 indicates discopathy that may or may not be associated with compressive myelopathy.

The clinical relevance of the mild degenerative joint disease of the coxofemoral joints is questionable.
