

PATIENT

Marley Lardeau

PRESENTING CLINICAL SIGNS

Intermittent lameness Right forelimb. Hx of right shoulder injury a few years ago. Chronic right bicipital tenosynovitis, right humoral osteochondrosis, DJD.
Abnormal PE/Chem/CBC/UA Results: Ambulatory x 4 prior to CT, no obvious lameness

SPECIES

Canine

COMPUTED TOMOGRAPHY OF THE FRONT LIMBS

A high resolution pre- and post-contrast CT study of the front limbs is provided for review.

BREED

English Lab

COMPUTED TOMOGRAPHIC FINDINGS

Mild exostosis formation is seen in the intertubercular groove bilaterally . A mineralized body, measuring 7 x 3 x 6 mm in size is seen in the region of the tendon of the right supraspinatus muscle. The humeral head bilaterally presents smooth margins of the subchondral bone.

SEX

Male Neutered

Both elbow joints present smooth osseous margins. The tip of the medial coronoid process bilaterally presents with a beak-shaped conformation – considered as a normal anatomical variant.

AGE

6 Years

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Exostosis formation intertubercular sulcus shoulder joints bilaterally
- Calcifying tendinopathy right supraspinatus muscle
- Normal elbow joints bilaterally

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The exostosis formation in the intertubercular sulcus of the shoulder joints can be a sequela to pathology of the bicipital tendon. Ultrasound can be used as an advanced imaging modality to evaluate the bicipital tendon.

HOSPITAL NAME

Mobile Pet Imaging

The clinical relevance of the calcifying tendinopathy is unclear and contrarily discussed in literature.

REFERRING VET

Meaux

The elbow joints present without abnormalities.
