PRESENTING CLINICAL SIGNS

P is only wanting to be hand fed however it was a concern to O when P didn't want to be hand fed this morning and vomited up white foam this morning 3 times. P does like to go in the other room and find "treasures" that he brings to O

Abnormal PE/Chem/CBC/UA Results: Abd/GI: Palpates soft and with no organomegaly, masses, or pain noted. Straining to defecate: Intestinal parasites vs GI Dz vs open. Vomiting: FB/obstruction vs infection (viral vs bacterial vs parasitic vs fungal) vs dietary indiscretion vs pancreatitis vs open.

RADIOGRAPHIC STUDY OF THE ABDOMEN

Radiographs of the thorax in three imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

The liver is appropriate in position, size and presents uniform opacity.

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

The stomach is in its anticipated position and is empty, but a small amount of gas.

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

The colon is seen in the expected position and presents with appropriate content.

RADIOGRAPHIC DIAGNOSIS

- Empty gastrointestinal tract

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study reveals no abnormalities that do explain the vomiting. There is no evidence of radiopaque foreign material, abnormal gas pattern or signs for gastrointestinal mechanical obstruction. If clinical signs are refractory to therapy, recommend follow up radiographs in two orthogonal imaging planes or a complete abdominal ultrasound examination; in some cases, a high ileus may lack classical radiographic signs of mechanical obstruction.
