DATE

12/5/25

PRESENTING CLINICAL SIGNS

History: Chronic recurrent otitis media/interna and subsequent Horner's syndrome that improves with antibiotics but then relapses off. Otoscopy performed following CT and copious amount of purulent fluid drained following myringotomy.

COMPUTED TOMOGRAPHIC STUDY OF THE SKULL

A high resolution pre- and post-contrast CT study of the skull is provided for review.

COMPUTED TOMOGRAPHIC FINDINGS

Multiple teeth are absent. Level with absent triadan 104, a defect is appreciated in the alveolar bone – complete covered by gingiva.

The nasal cavity presents the expected aerated spaces between thin & even conchae and turbinates with smooth mucosal lining.

Both temporomandibular joints present congruent joint spaces with even subchondral bone surfaces and are considered within normal limits.

The right tympanic bulla is filled with soft tissue attenuating material. The osseous lining of the right tympanic bulla is mildly thickened and rough. The right auditory tube is mildly distended by gas. The external ear canals are within normal limits.

The brain presents no deviation from normal anatomy and symmetry. The brain parenchyma is homogeneous and within normal limits for attenuation and distribution of contrast enhancement. The ventricular system is non-dilated and symmetric.

The medial retropharyngeal lymph nodes are prominent

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Right sided chronic otitis media without inflammatory polyp formation
- Lymphadenopathy medial retropharyngeal lymph nodes
- Multiple absent teeth

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The CT study is fitting the history of right sided otitis media – accompanying otitis interna is possible, but no abnormalities of the osseous structures of the inner ear are appreciated.
