

PATIENT PRESENTING CLINICAL SIGNS

Maggie Hill Maggie had an oral melanoma removed in Aug 2019. She had follow-up through oncologists, and has had a metastasis check and melanoma vaccination every 6 months since then. She has been clear of metastasis previously. Repeating thoracic radiographs today for her 6 month check. No clinical signs of note in Maggie at this time. Other history includes dx of Hypoadrenocorticism in 2016. Currently well-managed on Florinef. No other pertinent history/previous illness.

SPECIES Canine
Abnormal PE/Chem/CBC/UA Results: N/A

RADIOGRAPHIC STUDY OF THE THORAX

BREED Labradoodle
Radiographs of the in three imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

SEX FS
Mild spondylosis formation is seen along the thoracic spine. The costal cartilages present moderate degenerative changes.

The extrathoracic soft tissues present homogeneous without abnormalities.

AGE 12 Years
The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

HOSPITAL NAME

Anique McCrea-Spence

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

The lung parenchyma presents the expected architecture and opacity; the intrapulmonary vascular branching is seen up to the third order lung vessels.

REFERRING VET

McCrea-Spence

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

RADIOGRAPHIC DIAGNOSIS

- Degenerative changes costal cartilages
- Mild spondylosis deformans
- Otherwise normal thorax
