

PATIENT

MATEO
MALDONADO

PRESENTING CLINICAL SIGNS

ADR for the past 3 days. P had dental performed yesterday. O concerned of painful neck 10 days prior to dental. Not e/d, has not had bowel movement. P has had continued intermittent decrease in app since visit on 11/28/2021. despite medication therapy. P has declined over the 3 days. not e/d lethargic, painful to touch right side of neck.

SPECIES

Canine

Abnormal PE/Chem/CBC/UA Results: CPL ABNORMAL

RADIOGRAPHIC STUDY OF THE NECK

Radiographs of the neck in two orthogonal imaging planes are provided for review.

BREED

Terrier Mix

RADIOGRAPHIC FINDINGS

The osseous structures of the neck are within normal limits.

SEX

Neutered Male

The larynx is deviated ventrally. There is a mineralized rectangular body superimposed on the pharynx measuring approximately 4 cm in length and 1.4 cm in width. In the VD projection a mild curved linear mineral opacity is seen superimposed on the soft tissue on the right side of C1/C2.

RADIOGRAPHIC DIAGNOSIS

- Pharyngeal foreign body potentially wedged in the soft tissues of the pharynx and larynx – causing mild ventral deviation

AGE

9 Years

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The findings are compatible with a pharyngeal foreign body. Recommend thorough examination of the pharynx under general anesthesia.
