Canine

RADIOGRAPHIC STUDY OF THE ABDOMEN

BREED

Radiographs of the abdomen in three imaging planes are provided for review.

Australian Shepherd Mix

RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

SEX

Female

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

AGE

2 Years

The liver is appropriate in position, size and presents uniform opacity.

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

INTERPRETED BY

Sebastian Schaub, DVM
 Dr. med. vet. DipECVDI

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

HOSPITAL NAME

Byram Animal Hospital

The stomach is in its anticipated position and contains a mild amount of gas and fluid.

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

The colon is seen in the expected position and contains a mild amount of foamy fecal material and gas. The colon appears mildly adynamic.

REFERRING VET

Dr. Maria Cruz

RADIOGRAPHIC DIAGNOSIS

- Overall empty gastrointestinal tract with possible adynamic colon

INVOICE

48817

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study is most consistent with gastroenteritis. There is no evidence of radiopaque foreign material or signs for gastrointestinal mechanical obstruction. If clinical signs are refractory to therapy, recommend follow up radiographs or a complete abdominal ultrasound examination.
