

**PATIENT**

No Name Santiso

PRESENTING CLINICAL SIGNS

History: Pup consistently resists/resents hip abduction. Owner requesting review.

RADIOGRAPHIC STUDY OF THE PELVIS**SPECIES**

Canine

A ventrodorsal view of the pelvis is provided for review.

BREED

German Shepherd

RADIOGRAPHIC FINDINGS

The growth plates are age related open and the epiphysis are incompletely mineralized. The osseous and surrounding soft tissue structures of the pelvis are within normal limits.

RADIOGRAPHIC DIAGNOSIS**SEX**

Male

- Normal pelvis

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**AGE**

9 Weeks

The radiographic study of the pelvis presents normal age-related findings of the skeletal structures with open growth plates and incomplete mineralization of the epiphysis – resulting in a widened joint space. If clinical signs persist or lameness develops, recommend follow up radiographs of the pelvis in 2-3 weeks.

The information and recommendations provided are based on the images presented by the referring veterinarian/sonographer. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.

INTERPRETED BY

Sebastian Schaub,
DVM Dr. med. vet.
DipECVDI

Thank you for this referral. If the clinical or image interpretation does not parallel your findings or if I can be of any further assistance please contact me.
