PRESENTING CLINICAL SIGNS

Recently seen at ACCESS ER for acute right forelimb limping (Friday 12/5)

RADIOGRAPHIC STUDY OF THE SHOULDER JOINTS

Radiographs of the shoulder joints in two orthogonal image planes are provided for review.

RADIOGRAPHIC FINDINGS

At the caudal aspect of the right humeral head a prominent osseous spur is appreciated. The surrounding soft tissue structures of the right shoulder joint reveal no abnormalities.

In the pictured cranial parts of the thorax – the lateral aspect of the cranial part of the left cranial lung lobe, level with the 3rd intercostal space – a well-defined, roundish, uniform soft tissue opaque nodule is seen; measuring 2 cm in diameter.

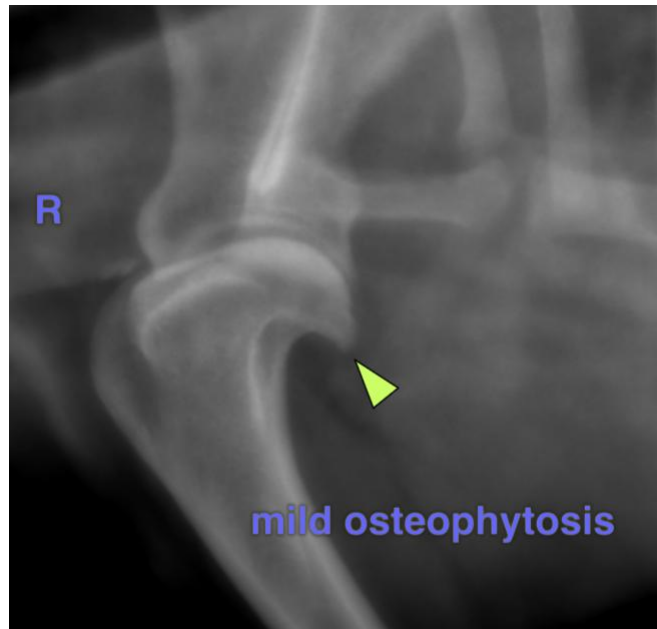

RADIOGRAPHIC DIAGNOSIS

- Solitary pulmonary soft tissue nodule
- Mild osteoarthritis right shoulder joint

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study of the right shoulder joint reveals no abnormalities, that do explain the acute right front limb lameness. Rule out pain originating from the cervical spine or brachial plexus region as well.

The solitary pulmonary soft tissue nodule can present neoplasia, granuloma, pulmonary cyst. Ultrasound guided FNA sampling can be performed for specification.
