

**PATIENT**

Scooter Dziejulska

PRESENTING CLINICAL SIGNS

eating now, but his walking badly, favouring back left leg. Having trouble with stairs PAIN DURING PALPATION OF THE LEFT STIFLE , MILD CRANIAL DRAWER TEST POSITIVE, . abnormal posture , gait and walking, mild muscle wasting or atrophy.

SPECIES

Feline

Abnormal PE/Chem/CBC/UA Results: BW done 10 days ago diagnosed with renal insufficiency.

RADIOGRAPHIC STUDY OF THE STIFLE JOINTS**BREED**

DMH

Radiographs of the stifle joints in two orthogonal imaging planes are provided for review.

RADIOGRAPHIC FINDINGS**SEX**

Male Neuter

The osseous margins of the stifle joints bilaterally are smooth and there are no signs for intracapsular soft tissue swelling. A small convex shaped exostosis is protruding from the cranioproximal aspect of the patella bilaterally. At the medial aspect of the stifle joints bilaterally, a well-defined, linear, mineralized body, measuring approximately 2 mm in size is noted.

The left popliteal lymph node is prominent.

AGE

13 Years

There is a moderate intracapsular soft tissue swelling of the left talocrural joint.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

RADIOGRAPHIC DIAGNOSIS

- Moderate articular swelling left talocrural joint
- Lymphadenopathy left popliteal lymph node
- Suspect small metaplasia medial aspect joint capsule bilaterally
- Otherwise normal stifle joints

HOSPITAL NAME

St. Catherine's Animal
Hospital

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The stifle joints present without abnormalities, explaining the hind limb lameness. There is evidence of joint effusion of the left talocrural joint; a synovial tap is recommended to rule out inflammatory or infectious arthritis.

REFERRING VET

Dr. Masoud

Suspect secondary reactive hyperplasia of the left popliteal lymph node.
