

**PATIENT PRESENTING CLINICAL SIGNS**

Timmy TLC P hasn't pooped since wednesday and P take 2 minutes to urine after he squats P hasn't been drinking that much water O wants to check E okay no c/s/v/d  
Abnormal PE/Chem/CBC/UA Results: Diag- TP 8.1, Glob 5.1

**SPECIES RADIOGRAPHIC STUDY OF THE THORAX & ABDOMEN**

Feline A complete set of radiographs of the thorax and abdomen is provided for review.

**BREED RADIOGRAPHIC FINDINGS**

DSH Thorax

The surrounding bony structures are within normal limits.

**SEX** The extrathoracic soft tissues present homogeneous without abnormalities.

Male The heart is prominent and presents a mild valentine shape in the VD view. The pulmonary vasculature is within normal limits.

**AGE** The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

5

**INTERPRETED BY** The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

Sebastian Schaub, DVM  
Dr. med. vet. DipECVDI

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

**HOSPITAL NAME** The left cranial lung lobe presents a zone of ground glass opacification and a mild decreased volume.

Animal Paradise  
Hospital

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

**REFERRING VET Abdomen**

Dr. Elshafie Both coxofemoral joints present moderate osteophyte new bone formation. The acetabular groove bilaterally is shallow, and the center of the femoral heads is lateral to the dorsal acetabular rim.

**INVOICE** No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

50262

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

**DATE** The liver is appropriate in position, size and presents uniform opacity.

2-12-22

The splenic head is in the anticipated position and within normal limits for size and opacity.

**PATIENT**

Timmy TLC

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract. An os penis is visible.

The stomach is in its anticipated position and presents normal content.

**SPECIES**

Feline

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

The colon is seen in the expected position and contains a moderate amount of fecal material – presenting a mild increased radiopacity.

**BREED**

DSH

**RADIOGRAPHIC DIAGNOSIS**

**SEX**

Male

- Mild cardiomegaly
- Possible constipation
- Region of increased radiopacity of the left cranial lung lobe
- Degenerative osteoarthritis coxofemoral joints bilaterally, due to hip dysplasia

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

**AGE**

5

The radiographic study presents no abnormalities, explaining the possible strangury, there are no signs for mineral opaque calculi. Recommend complementing workup by complete urinalysis.

**INTERPRETED BY**

Sebastian Schaub, DVM  
Dr. med. vet. DipECVDI

The fecal material in the colon presents a mild increased radiopacity, indicating exsiccation of the fecal material and is suggestive for constipation.

The mild cardiomegaly can present a normal anatomical variant, however a cardiac echo can be considered to rule out underlying cardiomyopathy.

**HOSPITAL NAME**

Animal Paradise  
Hospital

The focal zone of pulmonary consolidation of the left cranial lung lobe is most consistent with a region of dystelectasis. The most likely differential is pneumonia.
