SEX RADIOGRAPHIC STUDY OF THE ABDOMEN

NM Radiographs of the abdomen in two orthogonal imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

AGE The surrounding bony structures are within normal limits.

1 Year, 11 Months No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

The liver is appropriate in position, size and presents uniform opacity.

HOSPITAL NAME

DPC Veterinary
Hospital

The splenic head is in the anticipated position and within normal limits for size and opacity.

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

REFERRING VET

Dr. Feldt

The stomach is in its anticipated position and empty.

The small intestinal loops are of even diameter, non-dilated and mildly corrugated. A small amount of gas is seen within the small intestinal loops.

INVOICE

50311

The colon is seen in the expected position and presents with appropriate content.

RADIOGRAPHIC DIAGNOSIS

- Empty gastrointestinal tract
- Suspect mild hypermotility of the small intestinal tract

DATE

2-15-22

PATIENT

Tui Hanson

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study of the abdomen presents without overt abnormalities, but the empty gastrointestinal tract being a sequela to the presenting clinical signs of hyporexia. The corrugation of the small intestinal loops can be a sequela to enteritis.

SPECIES

Feline

Complementing workup by complete blood work appears beneficial. If clinical signs are refractory to therapy, recommend follow up radiographs or a complete abdominal ultrasound examination.
