

PATIENT

Lucy Hanna

PRESENTING CLINICAL SIGNS

History of rDVM recommending radiographs of L forelimb. Noted swollen 2nd digit 8 months prior visit. O suspects injury 8 months ago.

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE LEFT FRONT LIMB

Radiographs of the left front paw in two orthogonal imaging planes are provided for review.

BREED

Labrador Retriever

RADIOGRAPHIC FINDINGS

The second digit of the left front paw presents with a mild to moderate, circumferential soft tissue swelling. The middle phalanx of the second digit presents moderate to marked osteophyte new bone formation.

SEX

FS

The metacarpophalangeal joint of the second digit of the left & right front paw presents moderate enthesophyte formation.

AGE

5

- Moderate osteophyte and exostosis formation middle phalanx second digit left front limb
- Mild circumferential swelling second digit left front paw
- Enthesophyte formation metacarpophalangeal joint second phalanx front paws bilaterally

INTERPRETED BY

Sebastian Schaub, DVM

RADIOGRAPHIC DIAGNOSIS

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The osseous changes seen along the middle phalanx of the second digit of the left front paw are supporting the diagnosis of preceding trauma with secondary osseous new bone formation. There are no signs for malignancy. If the patient is presenting without clinical signs, no advanced treatment options are warranted. If the patient presents with lameness of the respective limb and pain can be localized on the respective digit, amputation of the digit would be the therapy of choice.
