Loki Ott

**PRESENTING CLINICAL SIGNS**

OWNER NOTICED FREQUENT URINATION. IN AND OUT OF BOX AND URINATING OUTSIDE OF LITTERBOX

**SPECIES**

Feline

Abnormal PE/Chem/CBC/UA Results: Hydration: Appropriately hydrated Mentation: BAR EENT: No nasal discharge; clear no discharge OU; moderate dark brown exudate AU; throat wnl Oral Cavity: mild dental tartar present, P not tolerant of oral exam Lymph Nodes: Symmetrical, no changes in size, shape, consistency Skin: Good hair coat. Moist dermatitis (mod erythema, pus/mucus) on caudal thighs, inguinal area, and perineum CV/Respiratory: No murmur or crackles/wheezing auscultated. Normal bronchovesicular sounds. Abd/GI: Soft non painful abdomen Uro/Perineum: "see skin" Musculoskeletal: P laying throughout exam. BCS >9/9 Neurological: Appropriate

**RADIOGRAPHIC STUDY OF THE ABDOMEN**

**SEX**

Radiographs of the abdomen in two orthogonal imaging planes are provided for review.

**NM**

**RADIOGRAPHIC FINDINGS**

The body condition score is 9/9.

**AGE**

9 Years, 10 Months

The vertebral end plates L5/L6 present moderate spondylosis formation and the respective intervertebral disc space is mildly narrowed.

**INTERPRETED BY**

Sebastian Schaub, DVM  
Dr. med. vet. DipECVDI

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

The liver is appropriate in position, size and presents uniform opacity.

**HOSPITAL NAME**

DPC Veterinary Hospital

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

**REFERRING VET**

Dr. White

The volume of both kidneys is mildly decreased, and the margins are mildly irregular. A moderate amount of mineralized material is seen in the imaging plane of the renal pelvis bilaterally, L>R. The urinary bladder is mildly distended. An innumerable amount of mineralized calculi are seen in the urinary bladder – appears to be inspissated and attached to the urinary bladder wall.

The stomach is in its anticipated position and presents normal content.

**INVOICE**

50445

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

The colon is seen in the expected position and presents with appropriate content.

**DATE**

2-18-22

**RADIOGRAPHIC DIAGNOSIS**

- Cystolithiasis and mineralized material possibly attached to the urinary bladder wall
- Nephrolithiasis
- Mild nephropathy

**PATIENT**

Loki Ott

- Discopathy L5/L6
- Obesity

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

**SPECIES**

Feline

The cystolithiasis (e.g. calcium oxalate, struvite) and potential accompanying cystitis is a plausible explanation for the presenting clinical signs. If not done so yet, complete urinalysis is recommended. Surgical intervention to remove the urinary calculi appears beneficial.
