

PATIENT

Zoey Outwater

PRESENTING CLINICAL SIGNS

Tumor 5th digit RF

SPECIES

Canine

COMPUTED TOMOGRAPHY OF THE THORAX AND ABDOMEN

A high resolution pre- and post-contrast CT study of the thorax and abdomen are provided for review.

BREED

Labrador Retriever

COMPUTED TOMOGRAPHIC FINDINGS

Streak artefacts are emanating from the hind & front limbs, superimposing on the thorax/abdomen respectively.

SEX

Spayed Female

The front paws are only partially included within the field of view.

The pictured parts of the front paws present moderate osteophyte new bone formation of the metacarpophalangeal joint of the 2nd (L) and 3rd (R) metacarpophalangeal joint.

AGE

11 Years

Thorax

Multifocal spondylosis formation is seen along the thoracic spine and thoracolumbar junction.

The sternal, cranial mediastinal and tracheobronchial lymph nodes are small elongated with a normal short-to-long-axis-ratio is < 0.5, the attenuation and contrast enhancement pattern is uniform and considered within normal limits.

The cardiovascular structures including the pulmonary vasculature are within normal limits.

The bronchial tree presents with regular branching and tapers uniformly towards the periphery as expected, the bronchial walls are thin and smooth. The bronchus-to-artery ratio is within normal limits.

The lung parenchyma presents the expected architecture and attenuation behavior with interspersed punctuate mineralization.

Small incidental gas pockets are seen within the esophageal lumen, there is no evidence of abnormal dilation.

Abdomen

The serosal fat presents normal attenuation behavior. There is no evidence of peritoneal effusion or peritonitis.

Both kidneys present within normal limits for size, shape and organ architecture. After contrast administration a bilaterally symmetric and uniform nephro- and pyelogram is noted.

The adrenal glands are within normal limits for size, shape and organ architecture.

Both liver and spleen present with normal shape, even surface, uniformly attenuating parenchyma and homogeneous contrast enhancement, unremarkable.

PATIENT

Zoey Outwater

The pancreas is evenly contoured, the pancreatic parenchyma is homogeneous and presents uniform contrast enhancement.

SPECIES

Canine

The position, delineation, wall and content of the gastrointestinal tract are considered within normal limits throughout.

The bony and surrounding soft tissue structures reveal no abnormalities.

BREED

Labrador Retriever

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Spondylosis deformans
- Pulmonary osteomas
- Degenerative osteoarthritis metacarpophalangeal joints
- No evidence of pulmonary metastatic spread

SEX

Spayed Female

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The CT study of the thorax and abdomen presents without clinically relevant pathologies.

AGE

11 Years
