PRESENTING CLINICAL SIGNS

- Limping right hind leg for 24 hours
- Began carprofen 25mg

Abnormal PE/Chem/CBC/UA Results: Palpation - no evidence of CCL injury Rads bilateral mild stifle and hip arthritis smooth swelling noted at distal 1/3 of fibula RHL

RADIOGRAPHIC STUDY OF THE PELVIS & STIFLE JOINTS

A VD view of the pelvis and radiographs of the stifle joints in orthogonal image planes are provided for review.

RADIOGRAPHIC FINDINGS

The osseous and surrounding soft tissue structures of the pelvis are within normal limits. Both coxofemoral joints present a widened but congruent joint space.

The periarticular bones of both stifle joints present mild osteophyte new bone formation. The stifle joints present no sign of an intracapsular soft tissue swelling.

RADIOGRAPHIC DIAGNOSIS

- Mild osteoarthritis stifle joints bilaterally
- Mild widened joint space of the coxofemoral joints without overt degenerative joint disease.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study reveals signs of bilateral mild degenerative joint disease of the stifle joints, without overt articular soft tissue swelling. The degenerative joint disease may be a sequela to 'wear-and-tear' or can indicate early stage of pathology of the cranial cruciate ligament. Soft tissue injury may be a source for the acute presenting clinical signs as well.
