

**PATIENT PRESENTING CLINICAL SIGNS**

Blue Chiatar History: Blue presented for intermittent shifting FL lameness. No trauma reported. Owner noticed dog will favor a front limb after heavy exercise. Owner not sure what side is more prominent  
Abnormal PE/Chem/CBC/UA Results:

**SPECIES**

Canine

**RADIOGRAPHIC STUDY OF THE ELBOW JOINTS**

Radiographs of the elbow joints in two orthogonal imaging planes are provided for review.

**BREED**

German Shepherd

**RADIOGRAPHIC FINDINGS**

In comparison to the right elbow joint, the contour of the medial coronoid process of the left elbow joint is ill-defined and presents a decreased radiopacity. Mild to moderate osteophyte formation is seen at the proximal aspect of the anconeal process.

**SEX**

Neutered Male

A fingerprint like sclerotic zone is seen in the distal aspect of the left humeral diaphysis. The right elbow joint presents without abnormalities.

**AGE**

4 Years

**RADIOGRAPHIC DIAGNOSIS**

- Pathology of the coronoid process right elbow joint
- Mild degenerative osteoarthritis left elbow joint
- Myelosclerosis left distal humeral diaphysis – consistent with panosteitis

**INTERPRETED BY**

Sebastian Schaub,  
DVM Dr. med. vet.  
DipECVDI

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The radiographic study indicates disease of the medial coronoid process – such as FCP – with secondary mild degenerative joint disease. The findings are a plausible cause for left front limb lameness.

**HOSPITAL NAME**

Animal Surgical  
Center

The right elbow joint presents without abnormalities.
