PRESENTING CLINICAL SIGNS

Pt escaped from the house for one day on Feb 8th. The next day started limping on the right front leg. Limping has not improved. Now limping from the left front leg. No evidence of trauma or lacerations.

RADIOGRAPHIC STUDY OF THE THORAX AND LEFT SHOULDER JOINT

Radiographs of the thorax in three image planes and the left shoulder joint in two orthogonal image planes are provided for review.

RADIOGRAPHIC FINDINGS

Thorax

The vertebral endplates T5/T6 present mild spondylosis formation.

The extrathoracic soft tissues present homogeneous without abnormalities.

The heart is of normal size and shape; there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

The lung parenchyma presents the expected architecture and opacity; the intrapulmonary vascular branching is seen up to the third order lung vessels.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

Shoulder joints

The osseous and surrounding soft tissue structures of the left shoulder joint are within normal limits. The left scapula reveals no abnormalities.

RADIOGRAPHIC DIAGNOSIS

- Normal thorax
- Normal left shoulder joint

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study reveals no abnormalities and an underlying cause for the shifting front limb lameness cannot be specified.
