

PATIENT

Pepper Chowen

PRESENTING CLINICAL SIGNS

Chronic lameness left fore. Pain isolated to left carpus. Scout films show radiolucency at distal radius- suspect neoplasia.

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE LEFT CARPAL JOINT

Radiographs of the left carpal joint are provided for review.

BREED

Bernese Mountain
Dog Mix

RADIOGRAPHIC FINDINGS

The left distal radius – affecting the distal radial epiphysis, metaphysis and diaphysis presents an ill-defined zone with permeative osteolytic lesions with mild endosteal scalloping. Very mild immature periosteal new bone formation is seen at the medial aspect of the distal segment of the radius. There is a mild circumferential, homogeneous soft tissue swelling surrounding the left distal radius.

SEX

Spayed Female

RADIOGRAPHIC DIAGNOSIS

- Monostotic aggressive osteolytic lesions left distal radius with surrounding mild soft tissue swelling

AGE

7 Years, 7 Months

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The findings are compatible with primary osseous neoplasia originating from the left distal radius – such as osteosarcoma, chondrosarcoma, round cell tumor, other. FNA sampling or bone biopsy can be used to confirm the diagnosis.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

Consider complementing tumor staging by 3-view thoracic radiographs.
