

PATIENT PRESENTING CLINICAL SIGNS

Bubba Kyle Recurrent abscess on left ventral neck has been occurring since August, resolves with antibiotics but then comes back once antibiotics stop. FNA confirmed abscess with associated cellulitis
 Abnormal PE/Chem/CBC/UA Results: Increased WBC $29.59 \times 10^9/L$

SPECIES COMPUTED TOMOGRAPHY OF THE SKULL

Canine A high resolution pre- and post-contrast CT study of the skull is provided for review.

BREED COMPUTED TOMOGRAPHIC FINDINGS

St. Bernard X The pictured parts of the dentition are complete and unremarkable in all jaw quadrants.

The nasal cavity presents the expected aerated spaces between thin & even conchae and turbinates with smooth mucosal lining.

SEX Both temporomandibular joints present congruent joint spaces with even subchondral bone surfaces and are considered within normal limits.

Mi Both tympanic bullae are aerated, the mucosal lining is not seen, the bony wall is smooth and thin. The external ear canals are within normal limits.

AGE The brain presents no deviation from normal anatomy and symmetry. The brain parenchyma is homogeneous and within normal limits for attenuation and distribution of contrast enhancement. The ventricular system is non-dilated and symmetric.

1 Year, 1 Month

INTERPRETED BY In the subcutaneous tissue of the left submandibular region, a diffuse moderate soft tissue swelling with significant fat-stranding of the subcutaneous fat is appreciated. Post contrast administration, level with the larynx, a well-defined, irregular shaped, fluid attenuating zone is seen within the soft tissue swelling.

Sebastian Schaub, DVM
 Dr. med. vet. DipECVDI

The left submandibular and medial retropharyngeal lymph nodes are prominent.

HOSPITAL NAME COMPUTED TOMOGRAPHIC DIAGNOSIS

Bridgwater
 Veterinary Hospital
 and Wellness Centre

- History of recurrent abscess formation left submandibular region
- Lymphadenopathy left mandibular lymph nodes and left medial retropharyngeal lymph node

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

REFERRING VET The findings are consistent with the history, but the CT study fails to present an underlying cause. However, isoattenuating migrating foreign body might be a potential here. Consider complementing workup by an ultrasound examination of the respective region to screen for foreign material.
