

PATIENT

Karuk Loeb

PRESENTING CLINICAL SIGNS

Hw of intermittent R forelimb lameness
Abnormal PE/Chem/CBC/UA Results: Some decreased extension of R carpus No pain elicited

SPECIES

Ca

RADIOGRAPHIC STUDY OF THE RIGHT FRONT LIMB

A complete set of radiographs of the right front limb is provided for review.

BREED

Hound Mix

RADIOGRAPHIC FINDINGS

The grow plates are age related visible.

The subchondral bone at the caudal aspect of the right humeral head, presents an irregular crescent shaped shallow defect, measuring approximately 1 cm in length. The surrounding soft tissue structures of the right elbow joint are within normal limits.

SEX

MN

The right elbow joint presents smooth osseous margins, unremarkable. The contour of the medial coronoid process is well-defined and presents a homogeneous density.

AGE

11 Months

The osseous and surrounding soft tissue structures of the right carpal joint are within normal limits.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

RADIOGRAPHIC DIAGNOSIS

- Osteochondrosis dissecans (OCD) right shoulder joint
- Normal right elbow joint
- Normal right carpal joint

HOSPITAL NAME

Torch Lake
Veterinary Clinic

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The OCD lesion of the right shoulder joint is a plausible explanation for the described right front limb lameness and no additional abnormalities of the osseous and surrounding soft tissue structures are appreciated. Recommend complementing workup by mediolateral projection of the left shoulder joint as well, to rule out bilateral OCD lesion.
