

#### PATIENT

Crockett Schultz

#### PRESENTING CLINICAL SIGNS

History: Acute onset severe neck pain and left front lameness on 1-27-22. Holding head low and would yelp with attempts to raise head. Left front was non-weight bearing and knuckling at the time. Patient has gradually become more comfortable and is now toe-touching on left front. Painful on shoulder manipulation. Normal CP all four limbs. Eating and drinking. More comfortable with neck movement.

#### SPECIES

Canine

#### RADIOGRAPHIC STUDY OF THE NECK AND SHOULDER JOINTS

#### BREED

Bernadoodle

Radiographs of the neck and shoulder joints in two imaging planes are provided for review.

#### RADIOGRAPHIC FINDINGS

The lateral projection of the neck is moderately rotated.

#### SEX

Male

The growth plates are age related open and age-related incomplete mineralization of the epiphysis of the vertebra is seen.

The shoulder joints are within normal limits.

#### AGE

7 Weeks

#### RADIOGRAPHIC DIAGNOSIS

- Normal neck and shoulder joints

#### INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

#### INTERPRETED BY

Sebastian Schaub,  
DVM Dr. med. vet.  
DipECVDI

The radiographic study presents without abnormalities. However, evaluation is limited by the immaturity of the osseous structures. If clinical signs deteriorate again, re-evaluation the patient is recommended – consider sedation to allow better positioning. Cross-sectional imaging can be considered if there is suspicion for pathology of the cervical spine.

#### HOSPITAL NAME

Q Street AH

**The information and recommendations provided are based on the images presented by the referring veterinarian/sonographer. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.**

Thank you for this referral. If the clinical or image interpretation does not parallel your findings or if I can be of any further assistance please contact me.
