

PATIENT

Bowie Temkin

SPECIES

Canine

BREED

Border Terrier Mix

SEX

MN

AGE

9Y, 10M, 20D

WEIGHT

6.7kg

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet.
DipECVDI

IMAGING PERFORMED BY

AMC/BF

HOSPITAL NAME

Green Dog Dental and
Wellness

REFERRING VET

Dr. Geist

INVOICE

73607

DATE

2-3-26

PRESENTING CLINICAL SIGNS

History:

- Bowie presented for an acute onset of apparent pain, manifesting as yelping when picked up and reluctance to jump or go for a walk this morning.
- The patient was tense, but the most significant reaction on palpation was noted with compression around the cervical (neck) area. No overt lameness was observed during in-clinic ambulation.

RADIOGRAPHIC STUDY OF THE CERVICAL & THORACIC SPINE

Radiographs of the cervical and thoracic spine in two orthogonal image planes are provided for review.

RADIOGRAPHIC FINDINGS

The intervertebral disc space C2/C3 and C6/C7 are mildly narrowed. The remainder of the osseous and soft tissue structures of the cervical spine are within normal limits.

The vertebral endplates T2/T3, T3/T4 and T5/T6 present mild spondylosis formation. No additional abnormalities of the osseous and surrounding soft tissue structures of the thoracic spine are appreciated.

RADIOGRAPHIC DIAGNOSIS

- Discopathy C2/C3 and C6/C7
- Spondylosis deformans multifocal along thoracic spine

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The narrowed intervertebral disc spaces along the cervical spine are indicative for discopathy that may or may not be associated with compressive myelopathy. The narrowing of the intervertebral disc spaces can be accentuated by positioning as well. If clinical signs deteriorate or neurological deficits develop, workup may be complemented by cross-sectional imaging of the spine.
