PRESENTING CLINICAL SIGNS

Intermittent lameness on RF x 4 months, particularly after agility training. Minimal response to NSAID therapy.
Abnormal PE/Chem/CBC/UA Results: Pre-op CBC and chem panel were unremarkable prior to OHE in January.

RADIOGRAPHIC STUDY OF THE ELBOW JOINTS

Radiographs of the right elbow joint in two orthogonal imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

The growth plates are age related open.

The periarticular bones of the right elbow joint present smooth osseous margins. The contour of the medial coronoid process has a homogeneous density.

RADIOGRAPHIC DIAGNOSIS

- Normal right elbow joint

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study of the right elbow joint presents without abnormalities. Rule out underlying soft tissue injury (e.g. pathology of the bicipital tendon, muscle strain). If clinical findings are highly suggestive for underlying elbow dysplasia, recommend a CT study of the elbow joints.

PATIENT

Journey Simpson

The information and recommendations provided are based on the images presented by the referring veterinarian/sonographer. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.

SPECIES

Canine

Thank you for this referral. If the clinical or image interpretation does not parallel your findings or if I can be of any further assistance please contact me.
