

PATIENT

Bella Urniasz

PRESENTING CLINICAL SIGNS

Pet has a history of diabetes, hypothyroidism, crystalluria and arthritis. Pet's current medications are carprofen, soloxadine, and vetsulin 9 units BID. Pet has a malignant melanoma on pet's neck. Abnormal PE/Chem/CBC/UA Results: Increased liver values. Otherwise pet does not have any other health issues.

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE THORAX

Radiographs of the thorax in three imaging planes are provided for review. Images are provided in JPEG file format.

BREED

Goldendoodle

RADIOGRAPHIC FINDINGS

Multifocal spondylosis formation is seen along the thoracic spine. The costal cartilages present moderate degenerative changes.

SEX

Female Spayed

In the subcutaneous tissue along the right lateral thoracic wall, an ovoid shaped, well-defined fat opaque mass is seen, extending from the 6th right rib up to the level of the 9th right rib.

The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

AGE

14 Years, 8 Months

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

HOSPITAL NAME

Denville Animal Hospital

The lung parenchyma presents the expected architecture and opacity; the intrapulmonary vascular branching is seen up to the third order lung vessels.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

RADIOGRAPHIC DIAGNOSIS

REFERRING VET

Doctor Reddy

- Subcutaneous lipoma right thoracic wall
- Degenerative changes costal cartilages
- Spondylosis deformans
