IMAGING PERFORMED BY

Mary Krueger, LVT

HOSPITAL NAME

Gentle Doctor Animal
Hospital

REFERRING VET

Miranda Thomassen

INVOICE

74139

DATE

3-11-26

PRESENTING CLINICAL SIGNS

Initially lameness on right front leg started in early February - unknown initial cause. Some improvement with Rimadyl, but not completely resolved. Left front leg images taken for comparison.

RADIOGRAPHIC STUDY OF THE FRONT LIMBS

A complete set of radiographs of the front limbs is provided for review.

RADIOGRAPHIC FINDINGS

Both shoulder joints present smooth margins of the periarticular bones and the surrounding soft tissue structures are within normal limits.

The elbow joints present smooth margins of the periarticular bones. The contour of the medial coronoid process of both elbow joints is well-defined and has a homogeneous density. The joint space of the elbow joints is congruent. The surrounding soft tissue structures of the elbow joints are unremarkable.

The antebrachium, carpus and front paw bilaterally reveal no abnormalities of the osseous and surrounding soft tissue structures.

RADIOGRAPHIC DIAGNOSIS

- Normal shoulder joints
- Normal elbow joints
- Normal carpus
- Normal front paws

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study of the front limbs reveals no abnormalities and an underlying cause for the right front limb lameness cannot be specified. Rule out possible soft tissue injuries or pain originating from the neck or brachial plexus region.

The information and recommendations provided are based on the images presented by the referring veterinarian/sonographer. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.

Thank you for this referral. If the clinical or image interpretation does not parallel your findings or if I can be of any further assistance please contact me.
