

PATIENT

Jolie Atwal

PRESENTING CLINICAL SIGNS

Limping on left rear limb since yesterday. Indoor cat. Frequently gets into fight with her housemate cat

SPECIES

Feline

RADIOGRAPHIC STUDY OF THE PELVIS

Radiographs fo the pelvis in two imaging planes are provided for review.

BREED

Japanese Bobtail

RADIOGRAPHIC FINDINGS

A moderate ventral subluxation of S1 ventrally is noted. The lumbosacral intervertebral disc space is moderately narrowed. The caudal vertebral endplate of L1 has a convex conformation and the cranial vertebral endplate of S1 presents with a corresponding concave conformation. Moderate spondylosis formation is seen at the lumbosacral junction. The caudate spine is malformed and shortened.

SEX

FS

The left ischial tuberosity is separated from the left ischial bone and is displaced laterally, ventrally and caudally.

AGE

3 Years

Both coxofemoral joints present smooth osseous margins and congruent joint spaces.

INTERPRETED BY

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

- Acute traumatic fracture left ischial tuberosity
- Congenital malformation of the lumbosacral junction with deformity of the respective vertebral endplates and ventral subluxation of S1

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The findings indicate preceding traumatic insult with secondary fracture of the left ischial tuberosity – the finding is a plausible explanation for the left hind limb lameness. Conservative management is the therapy of choice.
