

PATIENT PRESENTING CLINICAL SIGNS

Coulee Kane-Ronning chronic djd in both elbows, left worse than right, lame on left front, off loads onto right front when she stands. Pain on manipulation of both elbows but left is worse than right
Abnormal PE/Chem/CBC/UA Results: r/o infectious djd

SPECIES RADIOGRAPHIC STUDY OF THE ELBOW JOINTS

Canine Radiographs of the left elbow joint in two orthogonal imaging planes and the right elbow joint in a craniocaudal view are provided for review.

BREED RADIOGRAPHIC FINDINGS

Australian Cattle Dog Mix The periarticular bones of the left elbow joint present advanced osteophyte new bone formation. The tip of the contour of the medial coronoid process cannot be appreciated. The subchondral bone of the medial part of the humeral condyle, opposing the medial coronoid process is undulating.

The periarticular bones of the right elbow joint present advanced osteophyte new bone formation.

SEX RADIOGRAPHIC DIAGNOSIS

- Female Spayed
- Advanced degenerative osteoarthritis elbow joints bilaterally
 - Contact lesion medial part left humeral condyle
 - Coronoid disease left elbow joint

AGE

11

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

INTERPRETED BY

The radiographic changes of the elbow joints are fitting the history of degenerative joint disease, secondary to elbow dysplasia. If there is recent deterioration of clinical signs and elbow joints with advanced degenerative joint disease have an increased risk to be affected by infectious arthritis, a synovial tap can be performed to rule out infectious arthritis.
