

PATIENT PRESENTING CLINICAL SIGNS

Gizmo Vanderhayden not eating or drinking well since yesterday, and lethargic as per O. Loose stool with blood. Threw up bile 1x.
Abnormal PE/Chem/CBC/UA Results: BW pending

SPECIES RADIOGRAPHIC STUDY OF THE ABDOMEN

Canine Radiographs of the abdomen in three imaging planes are provided for review.

BREED RADIOGRAPHIC FINDINGS

Australian Shepherd X The surrounding bony structures are within normal limits, the growth plates are age related visible.

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

SEX The liver is appropriate in position, size and presents uniform opacity.

Male The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

AGE Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

6 Months The stomach is in its anticipated position and is empty, but a small amount of foamy material and gas.

INTERPRETED BY The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI The colon is seen in the expected position and contains a small amount of gas and foamy material.

HOSPITAL NAME RADIOGRAPHIC DIAGNOSIS

- Truscott Animal Hospital
- Overall empty gastrointestinal tract with small amount of foamy material in stomach and unformed fecal material in the colon
 - Mild generalized gas pattern small intestinal loops

REFERRING VET INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Dr. Medhat Meawad The pattern of the gastrointestinal tract in combination with the presenting clinical signs is suggestive for gastroenteritis. There is no evidence of radiopaque foreign material, abnormal gas pattern or signs for gastrointestinal mechanical obstruction. The material in the stomach is considered as chymus. If the patient had been fasted for >12h the odds for functional gastric emptying disorder are considered higher than for gastric foreign material. If clinical signs are refractory to therapy, recommend follow up radiographs or a complete abdominal ultrasound examination; in some cases a high ileus may lack classical radiographic signs of mechanical obstruction.
