

PRESENTING CLINICAL SIGNS

PATIENT

Osiris Almase

History: Patient presented for pre-operative rads prior to dental and mass removal. Patient has history of both mast cell tumor and soft tissue sarcoma
Abnormal PE/Chem/CBC/UA Results:

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE THORAX

Radiographs of the thorax in three imaging planes are provided for review. Radiographs are dated 2/9/22.

BREED

Pitbull Terrier

RADIOGRAPHIC FINDINGS

The body condition score is 7/9.

SEX

Spayed Female

Mild spondylosis formation is seen at the vertebral endplates T6/T7.

The extrathoracic soft tissues present homogeneous without abnormalities.

AGE

7.2 Years

The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

INTERPRETED BY

Sebastian Schaub,
DVM Dr. med. vet.
DipECVDI

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected. The lung parenchyma presents the expected architecture and generalized ground glass opacity; the intrapulmonary vascular branching is seen up to the third order lung vessels.

HOSPITAL NAME

Boca Park AH

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

RADIOGRAPHIC DIAGNOSIS

REFERRING VET

Dr. Corinna Gorgon

- Obesity
- Generalized mild to moderate unstructured interstitial pattern
- Spondylosis deformans T6/T7
- No evidence of pulmonary metastatic disease

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

INVOICE

14470

The unstructured interstitial lung pattern is likely a sequela to the nutritional status. No clinically relevant abnormalities are appreciated.
