RADIOGRAPHIC STUDY OF THE LEFT ANTEBRACHIUM

Radiographs of the left antebrachium in two orthogonal imaging planes are provided for review.

AGE RADIOGRAPHIC FINDINGS

1 Year, 10 Months

A diffuse mild soft tissue swelling is seen along the region proximal to the accessor carpal joint, effacing the soft tissue shadow of the flexor carpi ulnaris muscle. The remainder of the osseous and surrounding soft tissue structures of the left antebrachium, including the left carpus, are within normal limits.

INTERPRETED BY

RADIOGRAPHIC DIAGNOSIS

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

- Mild soft tissue swelling predominant at the caudal aspect of the antebrachium

HOSPITAL NAME INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

DPC Veterinary Hospital

The mild soft tissue swelling in combination with the presenting clinical signs is suggestive to be inflammatory in origin (e.g. allergic, infectious, insect bite). No osseous abnormalities are appreciated.
