

PATIENT PRESENTING CLINICAL SIGNS

Nahla Bush History: Nahla presented for Mass in right hind leg. This was first noted in august and grew over a few months period.

SPECIES Abnormal PE/Chem/CBC/UA Results: wbc low mono low lym low phosphorus low

Canine COMPUTED TOMOGRAPHIC STUDY OF THE HIND LIMBS

A high resolution pre- and post-contrast CT study of the hind limbs is provided for review.

BREED Poodle COMPUTED TOMOGRAPHIC FINDINGS

Female In the fascial plane between the right biceps femoris muscle and the semitendinosus muscle, a large, fat attenuating mass, measuring approximately 7.3 x 14.4 x 6.1 cm in size. The mass is extending from the caudal aspect of the right gluteal musculature distally along the caudal aspect of the femoral diaphysis, up to the caudal aspect of the right gastrocnemius muscle. The mass is infiltrating the right biceps femoris muscle, resulting in a feathered pattern of the muscle with interspersed fat. Medially the mass is mildly bulging into the caudal aspect of the pelvic canal – caudal to the right greater femoral trochanter. The sciatic nerve is running between the fat attenuating mass and the ischial bone and is displaced medially by the mass effect along the caudal aspect of the thigh.

AGE 9 Years COMPUTED TOMOGRAPHIC DIAGNOSIS

INTERPRETED BY Sebastian Schaub, DVM Dr. med. vet. DipECVDI

- Large infiltrative lipoma caudal aspect right thigh with extension into the pelvic canal and infiltration of the right biceps femoris muscle

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

There is an infiltrative lipoma at the caudal aspect of the right thigh, invading the biceps femoris muscle – the remainder of the lipoma present well-defined margins. The mass is extending into the caudal aspect of the pelvic canal, impinging the sciatic nerve. Surgical excision of the mass will warrant resection of the right biceps femoris muscle to decrease risk for reoccurrence.
