RADIOGRAPHIC STUDY OF THE ABDOMEN

SEX Radiographs of the abdomen in three imaging planes are provided for review.

SF

RADIOGRAPHIC FINDINGS

The base of the left femoral neck presents an irregular radiolucent line with surrounding sclerosis

AGE

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

8 Months

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

INTERPRETED BY

The liver is appropriate in position, size and presents uniform opacity.

Sebastian Schaub, DVM
Dr. med. vet. DipECVDI

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

HOSPITAL NAME

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

DPC Veterinary Hospital

The stomach is in its anticipated position and presents normal content.

The small intestinal loops are generalized mildly dilated by fluid and gas. In the cranioventral abdomen, plication of a small intestinal segment is seen with atypical shaped triangular shaped gas bubbles.

REFERRING VET

The colon is seen in the expected position and is empty.

Dr. Rivera

RADIOGRAPHIC DIAGNOSIS

- Small intestinal mechanical obstruction due to linear foreign body.
- Chronic fracture left femoral neck.
