

PATIENT PRESENTING CLINICAL SIGNS

Guinness Macdonald On 3/20/23 Guinness started to vomit on/off and lost his appetite. On 3/22/23 he was brought to his primary DVM where bloodwork, radiographs, and an abdominal ultrasound was performed. On BW the WBC was increased, ALP was increased but this is a chronic change according to the owner, and the pancreatic enzymes were increased. Owner is unsure if thoracic radiographs were performed. Abdominal ultrasound showed concern for a cranial abdominal mass and a left adrenal gland mass.

Canine Patient continues to not eat, is drinking water but appears to regurgitate/vomit afterwards. Owner originally made an appointment with Dr. Infernuso for a consultation in the beginning of April but is concerned that is too far away. Previous splenectomy and ulcerated lipoma removal last year.

BREED RADIOGRAPHIC STUDY OF THE THORAX

Plott Hound Radiographs of the thorax in three imaging planes are provided for review.

RADIOGRAPHIC FINDINGS

SEX The body condition score is 8/9.

MN The costal cartilages present moderate degenerative changes.

The extrathoracic soft tissues present homogeneous without abnormalities.

AGE The heart is of normal size and shape, there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

10 Years

INTERPRETED BY The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

Sebastian Schaub, DVM An endotracheal tube is appreciated in the cervical tracheal segment. The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

Dr. med. vet. DipECVDI

HOSPITAL NAME The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

Animal Surgical Center The lung parenchyma presents the expected architecture and opacity but zones of dystelectasis of the lung parenchyma due to general anesthesia; the intrapulmonary vascular branching is seen up to the third order lung vessels.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

REFERRING VET RADIOGRAPHIC DIAGNOSIS

- Hampton Vet**
- Obesity
 - Degenerative changes costal cartilages

INVOICE INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

57461 The radiographic study of the thorax is negative for pulmonary metastatic disease.
