

PATIENT PRESENTING CLINICAL SIGNS

Pintita Jusino PATIENT PRESENTED MULTIPLE SEIZURES DURING THE PAST FEW MONTHS. HAS BEEN TREATED WITH GABAPENTIN, TRAZODONE AND PHENOBARBITAL (NOT COMBINED). MRI not available in PR, so we performed a CT to RO/RI other possible causes of the seizures.

SPECIES COMPUTED TOMOGRAPHY OF THE SKULL

K9 A pre- and post-contrast CT study of the skull in a bone and soft tissue reconstruction is provided for review.

BREED COMPUTED TOMOGRAPHIC FINDINGS

Mixed The pictured parts of the dentition are complete and unremarkable in all jaw quadrants.

The nasal cavity presents the expected aerated spaces between thin & even conchae and turbinates with smooth mucosal lining.

SEX

Female Both temporomandibular joints present congruent joint spaces with even subchondral bone surfaces and are considered within normal limits.

Both tympanic bullae are aerated, the mucosal lining is not seen, the bony wall is smooth and thin. The external ear canals are within normal limits.

AGE

8 Years The brain presents no deviation from normal anatomy and symmetry. The brain parenchyma is homogeneous and within normal limits for attenuation and distribution of contrast enhancement. The ventricular system is non-dilated and symmetric.

INTERPRETED BY

The submandibular and medial retropharyngeal lymph nodes are small and elongated with a normal short-to-long-axis-ratio is < 0.5, the attenuation and contrast enhancement pattern is uniform.

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Structural normal brain

HOSPITAL NAME

Juana Diaz Animal Hospital

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

In the present study of the brain, there is no evidence of macromorphological disease, which supports the presumptive diagnosis of idiopathic epilepsy.

REFERRING VET

Jose Rivera Torres

If not yet done so the workup should be complemented by examination of CSF and complete bloodwork to screen for brain disease that is not necessarily associated with structural changes of the brain parenchyma and rule out hepatoencephalopathy and other systemic illness. In case of the strong clinical suspicion of structural intraparenchymal changes an MRI may be considered.
