PRESENTING CLINICAL SIGNS

Presented for sedated evaluation of hindlegs. Stiff in hind end (~6mos duration) and if P does much playing or exercising he is pretty slow moving and stiff. Littermate diagnosed with hip and elbow dysplasia. No known trauma. E/d/u/d wnl, no v/d/c/s noted. No other health concerns reported. Diet: Kirkland signature large breed - 2-3 cups BID. Current meds: none, has tried a joint supplement but didn't note much improvement. Flea tx: as needed, Bravecto in the past. Abnormal PE/Chem/CBC/UA Results: BCS 6/9 Pain response at attempts to manipulate hip joints while awake. No cranial drawer or tibial thrust while sedated.

RADIOGRAPHIC STUDY OF THE PELVIS

A ventrodorsal projection of the pelvis is provided for review.

RADIOGRAPHIC FINDINGS

The acetabular groove bilaterally is shallow, and the center of the femoral heads is lateral to the dorsal acetabular rim, L>>R. The femoral heads bilaterally are mildly misshapen and the joint spaces of the coxofemoral joints are incongruent. The periarticular bones of both coxofemoral joints present mild osteophyte new bone formation.

RADIOGRAPHIC DIAGNOSIS

- Hip dysplasia with secondary mild degenerative osteoarthritis of both coxofemoral joints

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The findings are consistent with degenerative joint disease of both coxofemoral joints due to hip dysplasia. Progressive degenerative joint disease is likely. Discussed potential surgical (e.g. TEP) or conservative treatment options (e.g. intraarticular glucocorticoid injection and physical therapy) with orthopedic surgeon.
