RADIOGRAPHIC STUDY OF THE PELVIS

SPECIES Radiographs of the pelvis in two orthogonal imaging planes.

Canine **RADIOGRAPHIC FINDINGS**

The vertebral endplates of the lumbosacral junction present smooth osseous margins and mild increased sclerosis of the subchondral bone. The vertebral endplates of the lumbosacral junction present mild ventral & lateral spondylosis formation.

BREED

Lab The osseous and surrounding soft tissue structures of the pelvis are within normal limits. Both coxofemoral joints present smooth osseous margins and congruent joint spaces.

AGE INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

5 Years The changes of the vertebral endplates of the lumbosacral junction are considered as a sequela to

INTERPRETED BY

degenerative osseous remodeling of the lumbosacral junction (e.g. secondary to degenerative lumbosacral stenosis). The odds for infectious origin are low, given the chronic clinical signs in case of discospondylitis I would expect more pronounced osseous changes with osteolytic lesions. Cross-sectional imaging can be used as advanced imaging modality.
